

The weir lost its funding. The camera kept counting.

Computer vision already counts salmon at about 16 sites in Alaska and BC. This series breaks down wins like that one, an everyday operation, one bottleneck, a targeted build, real numbers.

What the counting camera did

90%

reported counting accuracy in deployment CF-01

60 to 1

an hour of fish video read in about a minute CF-02

16 sites

running across Alaska and BC, aiming at 100 watersheds by 2028 CF-03

\$50k to \$10k

hardware cost per site since the first build CF-04

The honest part. Counting from sonar echograms in glacial rivers still ran about a 23 percent error in 2024 research tests. Advancing, not solved. We print that either way. CF-05

If a camera can count fish in a glacial river

it can count pallets in
a yard, boards in a kiln,
or trucks at a gate. The
bottleneck changes in
Anchorage. The
method does not.

**One company. One bottleneck. One
honest breakdown. Daily.**

Sources ride in the first comment. Built in Anchorage.
